Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

Disclosure; Page 112; 166pp; English.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXEBA and its derivatives selected from XZBBZBXEBA. BXZXB, BXZXZB, XBBXZXBBA and BBXZBBXZ; and (b) as second peptide template XBBXZXBB, XBBXZXBB, and (b) group consisting of XBBXBBX, SBXXBBX, BXXBXSB, SBBZXXBB, and XBBZXXBBXZBBX; where B = at least one positively charged amino acid; X = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of

half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antimicrobial peptide composition for the prevention and treatment of ections caused by organisms, such as bacteria and fungi, exhibiting

against organisms such as bacteria and fungi comprising a peptide of 5-150 anno acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid and retromers, extensions, combinations and fusions; and (2) antimicrobial activity of

invention relates to an antimicrobial peptide composition for use

leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial functions of lenkocytes, as dishifectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally

```
The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against occanisms such as bacteria and fungi. The AP comprises: (a) a posptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBZBXBXB, BXZXXB, XBBXZXBBX and BBXZBBXZ; and (b) a second peptide template XZBZXXB, XBBXZXBBX and BBXZBBXZ; and (b) a second peptide template XBBXXXBX, XBBXZBBX, and (b) a second peptide template XBBXXXBX, XBBXZBB, and XBBZXXBBXXBBX; where B = at least one positively charged amino acid; X = at least one anon-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of
antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agent to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial peptides for potentiating antimicrobial agents active

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5. 150 amino acide corts sequence (derived from PMP-1 and PMP-2, platelet microbicoidal protein), and retromers, runcations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also possible structures are fully described in the specification. Also core sequence selected from truncations of the peptides described activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid or for potentiating comprising a peptide of 13-74 containing an amino acid and microbial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial against organisms such as bacteria and fungi. Agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAX57557 represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alpha-helical structure and is believed to act as an ionophore, making holes in bacterial call membranes. The peptide and antibiotic act synergistially. See AAR13924-R13930 and AAR13936-7. (Updated on 25-MAR-2003 to correct PA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           comprise beta-lactam antibiotic and cationic oligopeptide, useful against
Enterobacteriaceae, Pseudomonas aeruginosa etc.
been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Compsns. for treating infections sensitive to beta-lactam antibiotics

The present invention relates to antiviral peptides containing a domain of 10-25 amino acids, where half the domain is positively charged and the other half is uncharged. The present sequence is an antiviral peptide of the invention. Oligomers consisting of at least two peptides coupled together are also included in the invention. The peptides are useful for treating viral infections such as human immunodeficiency virus (HIV) and herpes simplex virus (HSV) and for the treatment of cold sores, aphthous ulcers and viral bronchial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, histatin, DH5, antimicrobial peptide; endocarditis;
anti-infection; antiinflammatory; anti-repulsion; antifungal; antiviral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antiviral peptides comprising a domain of 10-25 amino acids, half of which is positively charged and half uncharged, useful for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Veerman ECI, Van 'thof W, Nibbering PH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           70.8%; Score 46; DB 3; Length 28; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide core sequence (derived from PMP-1 and PMP-2, platelet microbiodial protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as a crear and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial agents useful as individual antimicrobial agents that enhance the antimicrobial agents that enhance the antimicrobial agents that enhance the antimicrobial are in a conventional antimicrobials, agents that enhance the antimicrobial for potentiating that enhance the antimicrobial for potentiate or restore efficancy of conventional antimicrobials, agents that enhance the antimicrobial for potentials of prior art have generally been considered to have undesirable toxicity, immunogenicity and short to hology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammallan cell toxicity and shortness of effectiveness due to biodegradation, retaining activity and shortness of effectiveness due to biodegradation, retaining activity in plasma and covercome problems of toxicity, immunogenicity, and shortness of effectiveness due to biodegradation, retaining activity in plasma and effective antimicrobial peptides 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting

ID AAB:

```
This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alpha-helical structure and is believed to act as an ionophore, making holes in bacterial call membranes. The peptide and antibiotic act synergistically. See AAR13924-R13930 and AAR13936-7. (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Compsns. for treating infections sensitive to beta-lactam antibiotics -comprise beta-lactam antibiotic and cationic oligopeptide, useful against Enterobacteriaceae, Pseudomonas aeruginosa etc.
                                                                                                                                                                                                                                                                                               Compsns. for treating infections sensitive to beta-lactam antibiotics -comprise beta-lactam antibiotic and cationic oligopeptide, useful against Enterobacteriaceae, Pseudomonas aeruginosa etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      numan platelet factor 4 C-13 fragment; amphipathic alpha helix.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to medical device for application onto or into a body of a patient, coated with one or more naturally occurring peptides or proteins or synthetic peptides or their analogues having antimicrobial activity. The medical device is useful for application onto or into body of a patient and includes endotracheal tubes, intravenous catheters, or urinary catheters, syringe needles, contact lenses, prosthetic implants, cut as heart valves, bone implants, contact lenses, prosthetic implants, cut substitutes, dental implants and spinal implants. The medical device is also suitable for veterinary use. The peptide coated implants have antimiferammation and anti-repulsion activity, resulting in avoiding or inhibiting tissue loss after implantation and prevent bone degradation around the implants e.g. endocarditis. Cystatin-derived peptides inhibit both the proteolytic activity and growth of peptides inhibit both the proteolytic activity and growth of peptides inhibit both the proteolytic activity and growth of peptides have increased antibacterial, antifungal and antiviral activity. Sy counteracted and the medical device with an antimicrobial peptide or protein, the chance of the infection, including biofilm infection is effectively counteracted and the body of the patient is not oversensitive degainst and particular and particular and antiviral activity and growth of counteracted and the body of the patient is not oversensitive degainst and particular and antiviral activity and growth of antipare and antiviral activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                          Medical device, in particular implants and contact lenses for application into body of a patient, is coated with natural or synthetic antimicrobial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       against such peptides. The present sequence is a synthetic oligomeric antimicrobial peptide based on human histatin 5 (DH5) carboxy terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alphahelical structure and is believed to act as an ionophore, making holes in bacterial cell membranes. The peptide and antibiotic act synergistically. See AAR13924-R13930 and AAR13936-7. (Updated on 25-MAR-2003 to correct PA field.)

The present invention describes a threspeture formulation compression of the present invention describes a threspeture formulation compression is a method of treatment for bacterial disease comprising: (a) providing a subject with symptoms of bacterial disease with one or more fimbriae-binding compounds comprising a mannose of an anomeric configuration, an alpha-aromatic or heteroaromatic ring attached to the mannose by a glycosidic or pseudoglycosidic linkage and a functional group which provides a site for chemical modification remote from the mannose and a pharmaceutically carrier; and (b) administering the fimbriae-binding compound to the subject. Administration of one or more fimbriae-binding compound to the subject. Administration of one or more fimbriae-binding compounds can be used for treating subjects with symptoms of and for subjects at risk from bacterial diseases. Treatment of and prevention of blood-borne and toxin mediated diseases in particular sepsis in humans the effects of endotoxin is also possible. The compounds may also be used to identify bacteria according to their cell binding specificity's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  agglutination of yeast cells induced by type 1 pili bearing bacteria. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           through conjugation to reporter substances such as dyes, luminescent or fluorescent molecules and enzymes. The compounds also inhibit the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a therapeutic formulation comprising N-

by adding a Cys-amide to the carboxy terminus. This was used to produce an immunoadapter conjugate. Making a conjugate comprises covalently linking a surface-binding ligand (SBL) to a hapten via a spacer to form a ligand-spacer-lapten (LSH) compound, and reacting the compound with immunoglobulin (Ig) under conditions that allow for non- covalent binding of the Ig to the hapten of the compound. The conjugate can be used for the diagnosis, prevention and treatment of microbial infections, e.g. neurology, cancer and endocrinology, where Ig targeting can provide desired therapeutic effects. The methods for producing a conjugate can use small molecule targeting ligands to efficiently direct otherwise unreactive Ig to microbial targets. This targeting allows Ig to react with microbial structures that may not normally be accessible to Ig, or are incapable of stimulating antibody production

present sequence is an antibacterial peptide C18G, which was modified

Limulus antilipopolysaccharide factor; LALF; diagnosis; endotoxin; bacterial infection; antibacterial; fimbriae-binding compound; sepsis.

produce an immunoadapter conjugate. Making a conjugate comprises covalently linking a surface-binding ligand (SBL) to a hapten via a spacer to form a ligand-spacer-hapten (LSB) compound, and reacting the compound with immunoglobulin (1g) under conditions that allow for non-covalent binding of the Ig to the hapten of the compound. The conjugate can be used for the diagnosis, prevention and treatment of microbial infections, e.g. sepsis, influenza, virenian or fungemia. They can also be used in neurology, cancer and endocrinology, where Ig targeting can provide desired therapeutic effects. The methods for producing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    conjugate can use small molecule targeting ligands to efficiently direct otherwise unreactive Ig to microbial targets. This targeting allows Ig to react with microbial structures that may not normally be accessible to Ig, or are incapable of stimulating antibody production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial compsns. for diagnosis and therapy - comprising microbial surface binding ligand-spacer-hapten, non-covalently associated with
                                                                                                                                                               Antimicrobial; immunoglobulin; surface binding ligand; hapten; sepsis; influenza; viremia; fungemia; neurology; cancer; endocrinology; antibodiotic; antibody; antibiotic.

(phenylalanyl)-4-aminophenyl-alpha-D-mannopyranoside (1). Also described is a method of treatment for bacterial disease comprising: (a) providing a subject with symptoms of bacterial disease with one or more finbriae-binding compounds comprising a mannose of an anomeric configuration, an alpha-arcmatic or heteroarcmatic ring attached to the mannose by a glycosidic or pseudoglycosidic linkage and a functional group which provides a site for chemical modification remote from the mannose and provides a site for chemical modification remote from the mannose and promaraceutically carrier; and (b) administration of one or more fimbriae-binding compounds can be used for treating subjects with symptoms of and for subjects at risk from bacterial diseases. Treatment of and prevention of blood-borne and toxin mediated diseases in particular sepsis in humans and other animals can be carried diseases in particular sepsis in humans to identify bacteria according to their cell binding specificity's to identify bacteria according to their cell binding specificity's through conjugation to reporter substances such as dyes, luminescent or fluorescent molecules and enzymes. The compounds also inhibit the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Therapeutic formulation comprising N-{phenylalanyl}-4-aminophenyl-alpha-D -mannopyranoside or its cysteinyl derivative useful for diagnosing and treating bacterial diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   agglutination of yeast cells induced by type 1 pili bearing bacteria. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a therapeutic formulation comprising N-

                                                                                                                                                                                                                                                                                                  The present invention relates to antiviral peptides containing a domain of 10-25 amino acids, where half the domain is positively charged and the other half is uncharged. The present sequence is an antiviral peptide of the invention. Oligomers consisting of at least two peptides coupled together are also included in the invention. The peptides are useful for treating viral infections such as human immunodeficiency virus (HIV) and herpes simplex virus (HSV) and for the treatment of cold sores, aphthous ulcers and viral bronchial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, histatin, DHS, antimicrobial peptide; endocarditis,
anti-infection, antiinflammatory, anti-repulsion, antifungal; antiviral.

the interaction transcribed with one or more naturally occurring peptides or proteins or synthetic peptides or their analogues having antimicrobial activity. The medical device is useful for application onto or into body of a patient and includes endotracheal tubes, intravenous catheters, curinary catheters, syrings endotracheal tubes, intravenous catheters, curinary catheters, syrings enedles, contact lenses, prosthetic implants, such as heart valves, bone implants, voice prostheses, pace makers, joint substitutes, dental implants and appint implants and spinal implants. The medical device is also suitable for veterinary use. The peptide coated implants have anticinfection, antinflammation and anti-repulsion activity, resulting in avoiding or inhibiting tissue loss after implantation and prevent bone degradation around the implants e.g. endocarditis. Cystatin-derived peptides inhibit both the proteolytic activity and growth of peptides have increased antibacterial, antifungal and antiviral activity. By coating the medical device with an antimicrobial peptide or protein, the patient is not oversensitive against cuch peptides or proteins. Resistant bacterial strain is not formed against such peptides. The present sequence is a synthetic oligomeric antimicrobial peptide based on human histatin 5 (DHS) carboxy terminus
                                                                                                                                                                                                                                                                                                                                                                                                                                 Medical device, in particular implants and contact lenses for application into body of a patient, is coated with natural or synthetic antimicrobial peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to medical device for application onto or into a

The invention relates to an apolipoprotein (apo) A-1 mimetic peptide (I, ABB83703-ABB83786) that ameliorates a symptom of atherosclerosis, CC Camprising a sequence of 10-30 amino acids, at least one class A camphipathic helix, at least one D amino acid residue and which protects a phospholipid against oxidation by an oxidising agent. (I) is not the D-18A peptide, DWLKARYDKVAEKIKARP. (I) is useful for ameliorating a symptom of atherosclerosis in a mammal diagnosed as having one or more symptoms of atherosclerosis, or at risk for atherosclerosis and for mitigating or preventing a coronary complication (a symptom of atherosclerosis)

CC preventing a coronary complication (a symptom of atherosclerosis)

CC preventing a coronary complication (a symptom of atherosclerosis)

CC preventing a coronary complication (a symptom of atherosclerosis)

CC preventing a coronary complication (a symptom of atherosclerosis)

CC preventing a coronary disease, such as leprosy, tuberculosis, systemic recurrent inflammatory disease, such as leprosy, tuberculosis, systemic coronary disease, Alzheimer's disease and acquired immunodeficiency syndrome disease, Alzheimer's disease and acquired immunodeficiency syndrome coronary coloring cobstructive pulmonary disease, coronary calcification, calcific cortic stenosis, osteoporosis, rheumatod arthritis, or inflammatory response associated with bacterial, viral, fungal infection, an organ cranpalant, a wound, an implanted prosthesis, parasitic infection, an organ cranple, has elevated serum half-life and readily administered by oral coute even when the amino and/or carboxy termini are blocked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel apolipoprotein A-1 mimetic peptide useful for ameliorating symptom of atherosclerosis in a mammal, comprises at least one class A amphipathic helix and a D-amino acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

disease, AIDS, osteoporosis, coronary calcification, calcific aortic stenosis and rheumatoid arthritis. The present sequence is a peptide used to ameliorate one or more symptoms of atherosclerosis
                                                                                                systemic lupus erythematosus; idiopathic pulmonary fibrosis; scleroderma; polymyalgia rheumatica; chronic obstructive pulmonary disease; AIDS; acquired immune deficiency syndrome; tuberculosis; polyarteritis nodosa; Alzheimer's disease; coronary calcification; calcific aortic stenosis; rheumatoid arthritis; osteoporosis; cardiant; neuroprotective; nootropic; vasotropic; gastrointestinal; dermatological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide, which protects phospholipid against oxidation by oxidizing agent, used for preparing composition for treating or preventing coronary complication associated with acute phase response to inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel peptides having 10-30 amino acids and comprising at least one class A amphipathic helix or D amino acid residue, protecte a phospholipid against oxidation by an oxidising agent and is not the D-18A peptide. Peptides of the invention are useful to treat or prevent a coronary complication, particularly atherosclerosis
                                                                                    complication; atherosclerosis; inflammation; leprosy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             symptoms, associated with an acute phase response to an inflammation, particularly leprosy, tuberculosis, systemic lupus erythematcosus, polymyalgia rheumatica, polyarteritis nodosa, scleroderma, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's
                                                       SFnew peptide #17 used to ameliorate symptoms of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 41; DB 7; Length 14;

The present invention relates to novel peptides having 10-30 amino acids and comprising at least one class A amphipathic helix or D amino acid residue, protectes a phospholipid against oxidation by an oxidising agent and is not the D-18A peptide. Peptides of the invention are useful to treat or prevent a coronary complication, particularly atherosclerosis symptoms, associated with an acute phase response to an inflammation, particularly leprosy, tuberculosis, systemic lupus erythematosus, polymyalgia rheumatica, polyarteritis nodosa, scleroderma, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease, AlDS, osteoporosis, coronary calcification, calcific aortic stenosis and rheumatoid arthritis. The present sequence is a peptide used to ameliorate one or more symptoms of atherosclerosis
New peptide, which protects phospholipid against oxidation by oxidizing agent, used for preparing composition for treating or preventing coronary complication associated with acute phase response to inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of stimulating the formation and cycling of pre-beta high density lipoprotein-like particles and/or promoting lipid transport and detoxification in a mammal comprising administering to the mammal a peptide or a concatamer of a peptide. The method is useful in stimulating the formation and cycling of pre-beta high density lipoprotein-like particles and/or promoting lipid transport and detoxification in a mammal for treating osteoporosis or atherosclerosis. The present sequence represents the amino acid sequence of a class A peptide analogue.
                                                                                                                                                                                                                                                                                                                                  Stimulating the formation and cycling of pre-beta high density ilpoproteain-like particles or promoting lipid transport and detoxification in a mammal by administering to the mammal a peptide or a concatamer of a peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pre-beta high density lipoprotein-like particle, lipid transport, lipid detoxification, osteoporosis, atherosclerosis.

The method is useful in stimulating the formation and cycling of pre-beta high density lipoprotein-like particles and/or promoting lipid transport and detoxification in a mammal for treating osteoporosis or atherosclerosis. The present sequence represents the amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             atherosclerosis; D-18A peptide; acute phase response; inflammation; tuberculosis; AlDS; Alzheimer's disease; scleroderma; osteoporosis; rheumatoid arthritis; bacterial infection; viral infection; parasitic infection; fungal infection; parasitic infection; fungal infection; organ transplant; wound; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Stimulating the formation and cycling of pre-beta high density lippoprotein-like particles or promoting lipid transport and detoxification in a mammal by administering to the mammal a peptide concatamer of a peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to a new peptide that ameliorates a symptom of atherosclerosis comprising an amino acid sequence that: (i) comprises 10-30 amino acids, at least one class A amphipathic helix and D amino acid residue; (ii) protects a phospholipid against oxidation by an oxidising agent; and (iii) is not the D-18A peptide. The peptide further comprises a protecting group coupled to the amino or carboxyl terminus. It has greater than about 50% amino acid sequence identity with human or mouse apo A-1. The peptide is useful for preparing a composition for ameliorating a symptom of atherosclerosis or mitigating or preventing a coronary complication associated with an acute phase response to an inflammation in a mammal. Mitigating or preventing a coronary complication associated with an acute phase response to an inflammation in a mammal, where the coronary complication is a symptom of the same polypeptide in combination with an all L-form of the same polypeptide. The acute phase response is a symptom of a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propose a propo

```
The invention relates to a new peptide that ameliorates a symptom of atherosclerosis comprising an amino acid sequence that: (1) comprises 10-30 amino acids, at least one class A amphigathic helitz and D amino acid residue; (ii) protects a phospholipid against oxidation by an oxidising agent; and (iii) is not the D-18A peptide. The peptide further comprises a protecting group coupled to the amino or carboxyl terminum. It has greater than about 50% amino acid sequence identity with human or mouse apo A-1. The peptide is useful for preparing a composition for amelioration a symptom of atherosclerosis or mitigating or preventing a coronary complication associated with an acute phase response to an inflammation in a mammal. Where the coronary complication is a symptom of the same polypeptide. The acute phase response is atherosclerosis comprises administering the polypeptide in combination with an all L-form of the same polypeptide. The acute phase response is a inflammatory response associated with a recurrent inflammatory disease, a disease comprising tuberculosis, Alzheimer's disease, a disease comprising themeroid arthritis, or a condition comprising bacterial, viral, parasitic or fungal infection, organ transplant, wound, seppis, endocaci schock syndrome or implanted of the processing the present sequence represents a class A peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                New peptide, useful for preparing a composition for ameliorating a symptom of atherosclerosis or mitigating or preventing a coronary complication associated with an acute phase response to an inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           apolipoprotein A-I; apoA-I; apolipoprotein A-I like peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes synthetic apolipoprotein (apo) A-I like peptides (I) that ameliorate one or more symptoms of atherosclerosis. Comprides (I) that ameliorate one or more symptoms of atherosclerosis. Comparisons is a comprision (II) comprision; a stettin; and a peptide or a concatamer of a peptide that: ranges in length from 10-30 amino cor a concatamer of a peptide that: ranges in length from 10-30 amino cor phospholipid against oxidation by an oxidising agent; and is not the D-CO law peptide. (I) has antiatherosclerotic, cerebroprotective, osteopathic, dermatological, nootropic, neuroprotective and anti-HIV activities, and comparison to stimulate the formation and cartivities, osteopathic, denoxification, to prevent formation of oxidised phospholipids, to reduce decoxification of bone, and to induce recalcification of bone, and to induce recalcification of bone, and to induce recalcification of bone, in succeivation of bone, and to induce recalcification of bone, in succeivation of bone, and to induce recalcification of bone, in a mammal channor of bone, and to induce recalcification of bone, in succeivation of bone, and to induce recalcification of bone, in a mammal channor of bone, and to induce recalcification of bone, in a mammal diagnosed as having one or more symptoms of atherosclerosis or a risk for stroke or atherosclerosis. (I) is useful for enhancing the activity of a statin in a mammal by coadministering (I) with the statin, convastatin, alwastatin, parvastatin, alwastatin, convastatin, alwastatin, alwastatin, alwastatin, alwastatin, and before or after the statin. (I) is useful for mitigating one or more symptoms associated with atherosclerosis in a mammal by administering (I) and statin in a mammal by administering (I) and statin to the communal where the amount of statin a mammal by administering or inhibiting administered without the statin in a mammal by concernation or more symptoms of osteoporosis in a mammal by concernation or one or more symptoms associated in a mammal when ma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         eliminating decalcification of a bone and by inducing recalcification of a bone. (1) is useful for inhibiting a symptom of a disease such as polymyalgia rheumatica, polyarteritis nodosa, scleroderma, lupus erythematosus, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease, AlDS, coronary calcification, or calcific aortic stenosis. The present sequence represents an apoA-I like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reduce or eliminate one or more symptoms of osteoporosis by reducing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       calcific aortic stenosis. The present sequence represents an apoA-I like peptide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel synthetic apo-A-I like peptides (e.g., D-4F), having class A amphipathic helix, stimulates formation and cycling of pre-beta high density lipoprotein-like particles and thus useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mammal, where (I) is administered in a concentration sufficient

dermatological, nootropic, neuroprotective and anti-HIV activities, and can be used to stimulate the formation and cycling of pre-beta high density lipoprotein-like particles, to promote lipid transport and detoxification, to prevent formation of oxidised phospholipids, to reduce decalcification of bone, and to induce recalcification of bone. (I) is useful for mitigating one or more symptoms of atherosclerosis in a mammal (human or non-human) by administering (I) to the mammal, where (I) is in an excipient and administered as a unit dosage formulation. The mammal is a mammal diagnosed as having one or more symptoms of atherosclerosis or at risk for stroke or atherosclerosis. (I) is useful for enhancing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             peptides (I) that ameliorate one or more symptoms of atherosclerosis. Also described is a formulation (II) comprising: a statin; and a peptide or a concatamer of a peptide that: ranges in length from 10-30 amino acids; comprises at least one class A amphipathic helix; protects a phospholipid against oxidation by an oxidiating agent; and is not the D-18A peptide. (I) has antiatherosclerotic, cerebroprotective, osteopathic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes synthetic apolipoprotein (apo) A-I like
                                                                                                                                                                                                                                                                                                                                                                                                                              obstructive pulmonary disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel synthetic apo-A-I like peptides (e.g., D-4F), having class A amphipathic helix, stimulates formation and cycling of pre-beta high density lipoprotein-like particles and thus useful for treating
                                                                                                                                                                                                                                                                                                                apolipoprotein A-I; apoA-I; apolipoprotein A-I like peptide; apoA-I like peptide; atherosclerosis; statin; antiatherosclerotic; cerebroprotective; osteopathic; dermatological; nootropic; neuroprotective; anti-HIV; stroke; polymyalgia rheumatica; polyarteritis nodosa; scleroderma; lupus erythematosus; idiopathic pulmonary fibrosis; chronic obstructive pulmonary disease; Alzheimer's disease; AlbS; coronary calcification;
                                                                                                                                                                                                                                                                                Atherosclerosis ameliorating apoA-I like peptide SEQ ID NO:29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Navab M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 29; 81pp; English.

            chosen from cerivastatin, atorvastatin, simvastatin, pravastatin, fluvastatin, locastatin, rosuvastatin, and pitavastatin, [I] is administered simultaneously with the statin, or administered before or after the statin. (I) and/or the statin are administered as a unit dosage formulation. (I) is useful for mitigating one or more symptoms associated with atherosclerosis in a mammal by administering (I) and statin to the mammal, where the amount of statin is lower than the amount of statin administered without the peptide. The peptide is lower than the peptide administered without the statin. (I) is useful for reducing or inhibiting one or more symptoms of osteoporosis in a mammal by administering (I) to the mammal, where (I) is administered in a concentration sufficient to reduce or eliminate one or more symptoms of osteoporosis by reducing or eliminating decalcification of a bone and by inducing recalcification of
                                                                                                                                                                                                                             a bone. (I) is useful for inhibiting a symptom of a disease such as polymyalgia rheumatica, polyarteritis nodosa, scleroderma, lupus erythematosus, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease, AlbS, coronary calcification, or calcific aortic stenosis. The present sequence represents an apoA-1 like peptide, which is used in the exemplification of the present invention.
activity of a statin in a mammal by coadministering (I) with the statin
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Method for inhibiting target cell and virus growth - comprises administering amphiphilic peptide compsns, useful for treating viral and phytopathogenic infections, tumours and burns.

```
ö
                           The amphiphilic peptide (SEQ ID NO 43) was prepd. by standard solid phase methods. The peptide is an analogue of the peptide having SEQ ID NO 3 (ARR22824), with His substituted for Leu at position 4. Substitution and deletion analogues of this peptide have increased biological activity and are effective as pharma ceuticals e.g. antibiotics for bacterial, fungal or viral infections, or in spermicides or antitumour or antiparasitic agents. Additionally the peptides can be used in wound healing compsns. or for treating burns or other skin or eye infections. See also AAR22822-89. (Updated on 25-MAR-2003 to correct PR field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              microbial, anti-viral and anti-tumour activity. They are also useful for inhibiting, preventing or destroying the motility of sperm and hence have application in a spermicide preparation. They also have anti-parasitic activity and are useful in wound healing, as preservatives and sterilants and to inhibit growth of phytopathogenic microorganisms. The invention relates to an apolipoprotein (apo) A-1 mimetic peptide (I, ABB83703-ABB83708) that ameliorates a symptom of atherosclerosis, comprising a sequence of 10-30 amino acids, at least one class A amphipathic helix, at least one D amino acid residue and which protects a phospholipid against oxidation by an oxidising agent. (I) is not the D-18A peptide, DWLKARYDKVARKLKEAR. (I) is useful for ameliorating a symptom of atherosclerosis in a mammal diagnosed as having one or more symptoms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel apolipoprotein A-1 mimetic peptide useful for ameliorating symptom
     polyarteritis nodosa, scleroderma, idiopathic pulmonary fibrosis,
(AIDS), polyarteritis nodosa, scleroderma, idiopathic pulmonary fibrosis chronic obstructive pulmonary disease, coronary calcification, calcific acrtic stenosis, osteoporosis, rheumatorid arthritis, or inflammatory response associated with bacterial, viral, fungal infection, an organ transplant, a wound, an implanted prosthesis, parasitic infection, sepsis, endotoxic shock syndrome, and biofilm formation. (I) is highly stable, has elevated serum half-life and readily administered by oral route even when the amino and/or carboxy termini are blocked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Apolipoprotein A-1; Apo; atherosclerosis; Alzheimer's disease; acquired immunodeficiency syndrome; AIDS; osteoporosis; rheumatoid arthritis; biofilm formation; antiatherosclerotic; antiinflammatory; antileprotic; tuberculostatic; dermatological; osteopathic; antirheumatic; antiarthritic; antibacterial; virucide; fungicide; antiparasitic; vulnerary; immunosuppressive; vasotropic; anti-HIV; nootropic; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of atherosclerosis in a mammal, comprises at least one class A amphipathic helix and a D-amino acid.
                                                                                                                                                                                                                                                                       DB 5; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an apolipoprotein (apo) A-1 mimetic peptide (I, ABB83703-ABB83786) that ameliorates a symptom of atheroselerosis, comprising a sequence of 10-30 amino acids, at least one class A amphipathic helix, at least one D amino acid residue and which protects a phospholipid against oxidation by an oxidising agent. (I) is not the D-18 A peptide, DWLKAFYDKVARKLKBAF. (I) is useful for ameliorating a symptom of atheroselerosis in a mammal diagnosed as having one or more symptom of atheroselerosis, or at risk for atheroselerosis and for mitigating or preventing a coronary complication (a symptom of atheroselerosis) associated with an acute phase response to an inflammation in a mammal. The acute phase response is an inflammatory response associated with a ceurrent inflammatory disease, such as leprosy, tuberculosis, systemic lupus erythematosus, polymyalgia rheumatica, polymatteritis nodosa, clubus erythematosus, polymyalgia rheumatica, polymyarteritis nodosa, clease, Alzheimer's disease and acquired immunodeficiency syndrome
                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel apolipoprotein A-1 mimetic peptide useful for ameliorating symptom of atherosclerosis in a mammal, comprises at least one class A amphipathic helix and a D-amino acid.

preventing a coronary complication (a symptom of atherosclerosis)

preventing a coronary complication (a symptom of atherosclerosis)

associated with an acute phase response to an inflammation in a mammal.

The acute phase response is an inflammation in a mammal.

The acute phase response is an inflammatory response associated with a recurrent inflammatory disease, such as leprosy, tuberculosis, systemic lupus erythematosus, polymyalgia rheumatica, polyarteritis nodosa,

cleroderma, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease and acquired immunodeficiency syndrome (AIDS), polyarteritis nodosa, scleroderma, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, coronary calcification, calcific chronic obstructive pulmonary disease, coronary calcification, cartic stenosis, osteoporosis, rheumatoid arthritis, or inflammatory response associated with bacterial, viral, fungal infection, an organ transplant, a wound, an implanted prosthesis, parasitic infection, caspois, endotoxic shock syndrome, and biofilm formation. (I) is highly stable, has elevated serum half-life and readily administered by oral croute even when the amino and/or carboxy termini are blocked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       systemic lupus erythematosus; idiopathic pulmonary fibrosis; scleroderma; polymyalgia rheumatica; chronic obstructive pulmonary disease; AIDS; acquired immune deficiency syndrome; tuberculosis; polyarteritis nodosa; Alzheimer's disease; coronary calcification; calcific aortic stenosis; rheumatoid arthritis; osteoporosis; cardiant; neuroprotective; nootropic; vasotropic; gastrointestinal; dermatological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide, which protects phospholipid against oxidation by oxidizing agent, used for preparing composition for treating or preventing coronary complication associated with acute phase response to inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Therapy; coronary complication; atherosclerosis; inflammation; leprosy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                              and comprising at least one class A amphipathic helix or D amino actains residue, protects a phospholipid against oxidation by an oxidising agent and is not the D-18A peptide. Peptides of the invention are useful to treat or prevent a coronary complication, particularly atherosclerosis symptoms, associated with an acute phase response to an inflammation, polymyalgia rheumatica, polymyalgia special, opporteritis nodosa, scleroderma, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease, ALDS, osteoporosis, coronary calcification, calcific aortic stenosis and rheumatoid arthritis. The present sequence is a peptide used to ameliorate one or more symptoms of atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       systemic lupus erythematosus, idiopathic pulmonary fibrosis, scleroderma, polymyalgia rhematica, chronic obstructive pulmonary disease, AIDS, acquired immune deficiency syndrome, tuberculosis, polyarteritis nodosa, Alzheimer's disease, coronary calcification, calcific stenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             agent, used for preparing composition for treating or preventing coronary complication associated with acute phase response to inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rheumatoid arthritis; osteoporosis; cardiant; neuroprotective; nootropic; vasotropic; gastrointestinal; dermatological.
                                           The present invention relates to novel peptides having 10-30 amino acids and comprising at least one class A amphibathic helix or D amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide, which protects phospholipid against oxidation by oxidizing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Therapy; coronary complication; atherosclerosis; inflammation; leprosy;
                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3F14 peptide #4 used to ameliorate symptoms of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                              ..

                                                                             symptoms, associated with an acute phase response to an inflammation, particularly leprosy, tuberculosis, systemic lupus erythematosus, polymyalgia rheumatica, polymretriis nodosa, scleroderma, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease, ALDS, osteoporosis, coronary calcification, calcific acric stenosis and rheumatoid arthriis. The present sequence is a peptide used to ameliorate one or more symptoms of atherosclerosis
                    The present invention relates to novel peptides having 10-30 amino acids and comprising at least one class A amphipathic helix or D amino acid residue, protects a phospholipid against oxidation by an oxidising agent and is not the D-18A peptide. Peptides of the invention are useful to treat or prevent a coronary complication, particularly atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or a

The mith density lipoprotein-like particles and/or promoting of pre-beta and detoxification in a mammal for treating osteoporosis or atherosclerosis. The present sequence represents the amino acid sequence of a class A peptide analogue.
promoting lipid transport and detoxification in a mammal comprising administering to the mammal a peptide or a concatamer of a peptide. The method is useful in stimulating the formation and cycling of pre-beta high density lipoprotein-like particles and/or promoting lipid transport and detoxification in a mammal for treating osteoporosis or atherosclerosis. The present sequence represents the amino acid sequence of a class A peptide analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

```
The invention relates to a new peptide that ameliorates a symptom of atherosclerosis comprising an amino acid sequence that: (i) comprises 10-30 amino acids, at least one class A amphipathic helix and D amino acid residue; (ii) protects a phospholipid against oxidation by an oxidising agent; and (iii) is not the D-18A peptide. The peptide further comprises or greater than about 50% amino acid sequence identity with human or mouse apo A-1. The peptide to the amino or carboxyl terminus. It has apo A-1. The peptide is useful for preparing a composition for ameliorating a symptom of atherosclerosis or mitigating or preventing a corporation associated with an acute phase response to an inflammation in a mammal. Mitigating or preventing a coronary complication associated with an acute phase response to an inflammation in a mammal. Where the coronary complication is a symptom of a mammal, where the coronary complication is a symptom of a mammal. Where the coronary complication is a symptom of a mammal. The same polypeptide in combination with an all L-form of the same polypeptide. The acute phase response is an inflammatory response associated with a recurrent inflammatory.
                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       atherosclerosis; D-18A peptide; acute phase response; inflammation; tuberculosis; AIDS; Alzheimer's disease; scleroderma; osteoporosis; rheumatoid arthritis; bacterial infection; viral infection; parasitic infection; tungal infection; parasitic infection; tungal infection; organ transplant; wound; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide, useful for preparing a composition for ameliorating a symptom of atherosclerosis or mitigating or preventing a coronary complication associated with an acute phase response to an inflammation

The invention relates to a new peptide that ameliorates a symptom of atherosclerosis comprising an amino acid sequence that: (1) comprises 10-30 amino acids, at least one class A amphipathic helix and D amino acid residue; (ii) protectes a phospholipid against oxidation by an oxidising agent; and (iii) is not the D-18A peptide. The peptide further comprises a protecting group coupled to the amino or carboxyl terminus. It has greater than about 50% amino acid sequence identity with human or mouse apo A-1. The peptide is useful for preparing a composition for ameliorating a symptom of atherosclerosis or mitigating or preventing a coronary complication associated with an acute phase response to an inflammation in a mammal. Mitigating or preventing a coronary complication associated with an acute phase response to an inflammation in a mammal. The complication is a symptom of atherosclerosis comprises administering the polypeptide in combination in a mammal. And all Liform of the same polypeptide. The acute phase response is an inflammatory response associated with a recurrent inflammatory disease, a disease comprising tuberculosis, AlDS, Alzheimer's disease, comprising tuberculosis, AlDS, Alzheimer's disease, comprising bacterial, viral, parasite or fungal infection, organ transplant, wound, sepsis, endotoxic shock syndrome or implanted
                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   atherosclerosis; D-18A peptide; acute phase response; inflammation; tuberculosis; AIDS; Alzheimer's disease; scleroderma; osteoporosis; rheumatoid arthritis; bacterial infection; viral infection; parasitic infection; fungal infection; organ transplant; wound; sepsis; endotoxic shock syndrome; implanted prosthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide, useful for preparing a composition for ameliorating a symptom of atherosclerosis or mitigating or preventing a coronary complication associated with an acute phase response to an inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes synthetic apolipoprotein (apo) A-I like peptides (I) that ameliorate one or more symptoms of atherosclerosis. Also described is a formulation (II) comprising: a statin, and a peptide or a concatamer of a peptide that: ranges in length from 10-30 amino acids; comprises at least one class A amphipathic helix; protects a phospholipid against oxidation by an oxidising agent; and is not the D-18A peptide. (I) has antiatherosclerotic, cerebroprotective, osteopathic, dermatological, nootropic, neuroprotective and anti-HIV activities, and can be used to stimulate the formation and cycling of pre-beta high density lipoprotein-like particles, to promote lipid transport and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  apoA-I like peptide, atherosclerosis, statin, antiatherosclerotic, cerebroprotective, osteopathic, dermatological, nootropic, neuroprotective, anti-HIV, stroke, polymyalgia rheumatica; polyarteritis nodosa; scleroderma, lupus erythematosus; didopathic pulmonary fibrosis, chronic obstructive pulmonary disease; Alzheimer's disease; AlDS; coronary calcification;
                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel synthetic apo-A-I like peptides (e.g., D-4F), having class A amphipathic helix, stimulates formation and cycling of pre-beta high density lipoprotein-like particles and thus useful for treating
  prosthesis. The present sequence represents a Class A peptide of the

detoxification, to prevent formation of oxidised phospholipids, to reduce decalcification of bone, and to induce recalcification of bone. (1) is useful for mitigating one or more symptoms of atherosclerosis in a mammal (human or non-human) by administering (1) to the mammal, where (1) is in an excipient and administered as a unit dosage formulation. The mammal is a mammal diagnosed as having one or more symptoms of atherosclerosis or at risk for stroke or atherosclerosis. (1) is useful for enhancing the chosen from cerivastatin, atorvastatin, simvastatin, pravastatin, chosen from cerivastatin, atorvastatin, and pitavastatin, pravastatin, fluvastatin, lovastatin, rosuvastatin, and pitavastatin, rosuvastatin, atorvastatin, or administered before or after the statin. (1) and/or the statin are administered before or after the statin. (1) is useful for mitigating one or more symptoms associated with a mammal by administering (1) and statin is lower than the peptide coministered without the statin is lower than the amount of statin administered without the statin is lower than the peptide administered without the statin is lower than the peptide administered without the statin is a mammal by administering or inhibiting one or more symptoms of osteoporosis in a mammal by administering or inhibiting or the mammal, where (1) is administered in a concentration sufficient to the mammal, where (1) is administered in a concentration sufficient to the mammal, where (1) is administered in a concentration sufficient to the mammal or more symptoms of estating or process or eliminate one or more symptoms of estating or stating or stating or stating or stating or stating or success or elements of stating or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible or successible o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    eliminating decalcification of a bone and by inducing recalcification of a bone. (I) is useful for inhibiting a symptom of a disease such as polymyalgia rheumatica, polyarteritis nodosa, scleroderma, lupus erythematosus, idiopathic pulmonary fibrosis, chronic obstructive pulmonary disease, Alzheimer's disease, AlDS, coronary calcification, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               coronary calcification, or erepresents an aboA-I like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     calcific aortic stenosis. The present sequence represents an apoA-I like peptide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               apolipoprotein A-I; apoA-I; apolipoprotein A-I like peptide; apoA-I like peptide; atherosclerosis; statin; antiatherosclerotic; cerebroprotective; osteopathic; dermatological; nootropic; neuroprotective; anti-HIV; stroke; polymyalgia rheumatica; polyarteritis nodosa; scleroderma; lupus erythematosus; idiopathic pulmonary fibrosis; chronic obstructive pulmonary disease; AlbS; coronary calcification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes synthetic apolipoprotein (apo) A-1 like present invention describes synthetic apolipoprotein (apo) A-1 like periods (1) that ameliorate one or more symptoms of atherosclerosis.

Also described is a formulation (II) comprising; a statin; and a peptide or a concatamer of a peptide that: ranges in length from 10-10 anno cardes or cardes to exhapt a concatamer of a peptide that: ranges in length from 10-10 anno cardes or cardes to exhapt a concatamer or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or cardes or 
                                                                                                                                                                       Novel synthetic apo-A-I like peptides (e.g., D-4F), having class A amphipathic helix, stimulates formation and cycling of pre-beta high density lipoprotein-like particles and thus useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 41; DB 8

The present invention relates to antiviral peptides containing a domain of 10-25 amino acids, where half the domain is positively charged and the other half is uncharged. The present sequence is an antiviral peptide of the invention. Oligomers consisting of at least two peptides coupled together are also included in the invention. The peptides are useful for treating viral infections such as human immunodeficiency virus (HIV) and herpes simplex virus (HSV) and for the treatment of cold sores, aphthous ulcers and viral bronchial infections
                                                                                                                                                                                                                                                                                                                                                                                          Antiviral peptides comprising a domain of 10-25 amino acids, half of which is positively charged and half uncharged, useful for treatment of human immunodeficiency virus and herpes simplex virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps.

The invention relates to antimicrobial peptides containing a domain of 10 the other half are uncharged, while most in the other half are uncharged. The positively charged, while most in synthesised by modifying the C-terminal sequence of histarin 5 peptide. The peptides are used to treat bacterial, fungal or yeast infections. Typical applications are control of Candida and of bacteria in the mouth, on the skin, in cattle and in foods. These antimicrobial peptides are subject to proteolysis and, being rather small, can be produced relatively inexpensively. They have practically no hemolytic action. The present sequence represents a specific example of the antimicrobial
                                                                                                     New antimicrobial peptides with two domains containing mostly positively charged or uncharged amino acids, e.g. for treating bacterial or fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antiviral peptides comprising a domain of 10-25 amino acids, half of which is positively charged and half uncharged, useful for treatment of human immunodeficiency virus and herpes simplex virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Veerman ECI, Van 'thof W, Nibbering PH;

The present invention relates to antiviral peptides containing a domain of 10-25 amino acids, where half the domain is positively charged and the other half is uncharged. The present sequence is a type 1 antiviral peptide. Oligomers consisting of at least two peptides coupled together are also included in the invention. The peptides are useful for treating viral infections such as human immunodeficiency virus (HIV) and herpes simplex virus (HSV) and for the treatment of cold sores, aphthous ulcers and viral bronchial infections
                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel conjugates of an antifungal peptide and a mucoadhesive polymer which have antifungal and cytostatic activity. The conjugates can be used to treat tumors and yeast, fungal and bacterial infections of the oral cavity, skin and vagina, especially yeast infections caused by Candida albicans and bacterial infections caused by Staphylococcus aureus, especially the methicillin-resistant strain MRSA. The polymer provides prolonged residence times at the site of infection, which compensates for the lower activity of the conjugates compared with the free peptides. AAY50848-Y50865 represent peptides used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antifungal peptide; mucoadhesive polymer; cytostatic; treatment; tumor; yeast infection; fungal infection; bacterial infection; oral cavity; skin; vagina.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide conjugates useful for treating yeast, fungal and bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Van Der Reijden WA;

The invention relates to a novel bone material for the prevention and treatment of osteomyelitis. This material makes use of a resorbable calcium phosphate cement, and a new class of antibiotic agents, the antimicrobial peptides (AMPB). The AMPB consist of an amino acid chain containing a domain of 10-25 amino acids, where the majority of the amino acids of the one half of the domain are positively charged amino acids (hydrophilic) and the majority of the amino acids of the other half of the domain are uncharged amino acids (hydrophilic) and the majority of the amino acids of the other half of the domain are uncharged amino acids (hydrophilic). The AMPB can be the surrounding area over a period of time. After curing, the bone material forms bone cement, and can serve as bone replacement. The bone material can be used for the prevention and treatment of infections of bone (osteomyelitis) and the surrounding soft tissues. The peptides have a wide spectrum of amibacterial and antifungal activity, even against mechicillin-resistant Stabylococcus aureus (MRSA), Pseudomonas acruginosa, and amphotericin-Bresistant Candida albicans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             granules which release antibiotics. However, PMMA granules are non-
resorbable, requiring an additional operation to remove them. Sequences
AAY77081-Y77088 represent type I AMPS, which form laterally amphipathic
alpha helices (i.e. a maximum hydrophobic moment of 100 degrees), and
which are claimed for use in the bone material of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         have low toxicity. Prior art methods of preventing bone/soft tissue infections after surgery make use of polymethyl methacrylate (PMMA)

Sequence 12, Application US/09525269A

Patent No. 6743769

GENERAL INFORMATION:
APPLICANT: Seaman, Michael R.
TITLE OF INVENTION: Antimicrobial Peptides and Derived
TITLE OF INVENTION: Metapeptides
FILE REFERENCE: 66742-025 (HRS614)
CURRENT FILING DATE: 2000-03-13
PRIOR APPLICATION NUMBER: US/09/525,269A
CURRENT FILING DATE: 1998-02-18

NUMBER OF SEQ ID NOS: 39

SOFTWARE: PastSEQ for Windows Version 4.0

SEQ ID NO 12
LENTH: 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ZIP: 98121

ORGANISM: Artificial Sequence AFATURE: OFFICE OF ON ONE SIGE, hydrophic on the OTHER INFORMATION: Peptide of Type I (hydrophobic on one side, hydrophilic on the OTHER INFORMATION: other side) having antimicrobial activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LOCATION: 14
COTHER INFORMATION: Modified peptide having antimicrobial activity
COTHER INFORMATION: Two identical amino acid chains of this composition
COTHER INFORMATION: are linked to one substituted lysine molecule at this point.
US-09-601-124-16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1, Application US/07725331

Patent No. 5294605

GENERAL INFORMATION:
APPLICANT: Houghten, Richard
APPLICANT: Houghten, Richard
APPLICANT: Blondelle, Sylvie
TITLE OF INVENTION: Amphiphilic Peptide Compositions and
TITLE OF INVENTION: Analogues Thereof
NUMBER OF SEQUENCES: 68

CORRESPONDENCE ADDRESS:
ADDRESSER: & Milnamow
STREET: 180 No. 5294605th Stetson
CITY: Chicago
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB 1; Length 23;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
